

## RECOMMENDATION TO ALL AMC CUSTOMERS COOLING SYSTEMS

To ensure the correct cylinder head performance and service life, **it is important to use a top quality coolant/inhibitor solution.**

In order **to protect the engine against corrosion** and premature damage, **the quality inhibitors include properties such as anticorrosion, ant cavitation, and antifreeze together** with other elements which low quality solutions may not contain.

We therefore make the following recommendations:

- **When fixing the new cylinder head ensure that the cooling system** is drained and the water/inhibitor mixture is completely replaced.
- **Do not try to save by using low cost/low grade coolant mixtures**, as this could result in false economy as far **the cylinder head/engine life is concerned.**

Low quality coolant mixtures can promote corrosion and will undermine the product guarantee.
